

## HOW IS QUALITY EDUCATION ACHIEVED?

**Hojieva Rukhsatbegim Tuymurod kizi**  
**Student of Uzbekistan State World Languages University**

**Annotation:** Education is the process of imparting knowledge, skills, and abilities and is the main means of preparing a person for life and work. In the process of education, information is obtained and education is carried out. Education means teaching in a narrow sense. But it means not only the process of teaching in different types of educational institutions but also the process of providing information in the family, production, and other areas. This article provides information on effective ways to improve the quality of education and achieve quality education, which is considered the most urgent need of today's era. Various facts and examples are also provided to convey the information perfectly.

**Key words:** knowledge, education, success, achievement, society, government, school, university, teacher, state, information, library, ancestor, effective, success.

The immortal teachings of our scholars in the period of the Eastern Renaissance have preserved their value to this day. Our great ancestors, such as Khorezmi, Beruni, Farabi, Ibn Sina, and Alisher Navoi, conquered the highest heights of world science with their scientific and creative heritage. It is not necessary to mention the hard way of educating our ancestors, who gave not only their wealth but also their whole lives to raise the morale of the people. At this point, the opinion of President Shavkat Mirziyoyev is relevant: "We need to create all the conditions so that the youth of our country can grow up worthy of their great ancestors, given to the world by great scholars and saints." So, the determination and enthusiasm characteristic of our great ancestors, the strong will of our people Our most pressing task is to consistently continue the process of radically renewing the life of our society, relying on our growing generation. The most important way to achieve this is through quality education. There are effective ways to achieve quality education, some of which we can consider below.

Success in education requires a two-pronged approach. That is, the government and society should act together. Initially, the state should carry out reforms step by step, starting with pre-school educational institutions and ending with higher educational institutions. Because "knowledge acquired in youth is a pattern carved in stone." It is possible to increase a child's love and interest in science from a young age by providing education from kindergarten on, teaching foreign languages, and involving him in any science and sports activities he is interested in. Kindertgartens have separate rooms for all science and sports groups, materials, and lessons led by expert teachers to brighten their future.

In addition, the school should become a student's second home. That is, it is necessary to act every morning not by force but with passion and the goal of learning new knowledge. Children are motivated to go to school only when they see the same love and conditions in their school as at home. It is true that our country has many opportunities compared to other countries. If free education and free textbooks are examples of this, there are several other opportunities that need to be created. That is, it is necessary to pay serious attention to education not only in urban centers but also in remote areas. Because the most dangerous and widespread situation is that young people full of passion, ability, and potential cannot realize their dreams and goals in the villages, It is necessary to carry out serious control throughout the republic, bring all schools into the center of attention, and create conditions for them.

When it comes to universities, there seems to be a lot that needs to change. It is known that all the knowledge acquired during the pre-student period, instead of increasing after becoming a student, not only remains unchanged but also decreases. First of all, it is necessary to get rid of this concept and try to destroy it. It can be said that everyone should think about

their future and work on it, but there are situations that the government should solve. There is no doubt that the quality of education will increase if students are given all the opportunities, if they are given confidence, and if strict requirements are set! It is necessary not only to work with one or two well-known students but also to give others a chance, discover them, and support them.

Another reform in the field of education, in my opinion, is the perfect development of optional subjects. Students should be trained in modules that match their interests, knowledge, and careers. If he is taught subjects unrelated to his field, he gets used to spending his student years in idleness. And some "adventurers" who are waiting for this will have a chance to take them home. That is why elective subjects should be developed perfectly and students should receive knowledge in accordance with their field. It is permissible to pay attention to education not only theoretically but also practically.

In addition, it is necessary to conduct various grants, scholarships, and contests, both by the state and by universities. There are such opportunities, but by increasing their number through awards and trust, we can cultivate not only one or two mature personnel but dozens and hundreds of potential masters of their work capable of changing the world.

In addition, when we say conditions, one more thing is embodied before our eyes. It was a source of knowledge—libraries. At present, there are information resource centers in all educational institutions, but the level of opportunity is not wide. It is necessary to be fully equipped not only with books but also with modern technologies. If the student learns to use the technology that is not available at home in the library and can perform the necessary actions through it, the quality of education will increase to another level.

If there is mention of the state's attention to education, now let's pay attention to the contribution of society to quality education! Let's look again at the period of childhood and what is given to the child during this period. They believe what they are told and draw their own conclusions. Therefore, education and upbringing should be provided correctly by parents. It is necessary to pay attention to the surrounding environment, invite students to the circle of readers, choose the right friends, and determine their interests. Apart from being the most innocent period, childhood is the most important period in a person's life. It is not right that adults are only busy and leave them in the hands of teachers. Teachers can give the same knowledge to all the students in the class, but they cannot give the same attention, love, and nurturing to everyone in the class. There are separate tasks that parents do and teachers do, and if they always work together in cooperation, not only education but also the changes in education will be huge. In order to turn a child into a scientist from a young age, putting him in countless clubs and extra classes and making his childhood difficult will not have a good effect; on the contrary, it will have a negative effect on the child's psychology. Parents, in consultation with the teacher, should know their children's interests and help them become experts in their field in this direction. The demand of this time is that learning foreign languages can always contribute to the development of society and the state. There is another important aspect to consider: the child's interests.

That is, it is necessary to teach them that learning foreign languages is the first step for their future and that they should always study.

Indeed, competition in the field of education paves the way for development. If those who strive to learn and teach knowledge compete with each other in this regard, both the quality and the number will undoubtedly increase. Of course, taking into account the creation of a spirit of friendly competition, it is necessary to encourage debate in terms of knowledge by organizing various debate competitions and grants. As mentioned above, elective subjects closely support this. Not only students but also teachers will be able to develop themselves. Since the choice of elective subjects and teachers is in the hands of the students, the teachers

also try to work on themselves and get noticed by more students. This creates a scientific competition between teachers. He is forced not only to teach and leave but also to show results in practice. Not only individuals but also educational institutions and organizations can increase the power of education by trying to cross paths.

So, in order to reach the top, first of all, there should be goals and plans aimed at it. Come on! Let's think of education as a sprout. If this sapling is given the warmth of the sun and nature, and if the gardener takes care of it with love, it will turn into a beautiful tree. If it pleases the gardener with its fruit, it gives pleasure to nature and people with its shade. If the root of the tree is educational reform and conditions, the trunk is firm demands, and the branches are goals and plans, then only the leaves can become faith and the fruits can become success. Therefore, the state should act as a living and benevolent nature, and society should become an experienced and skilled gardener.
